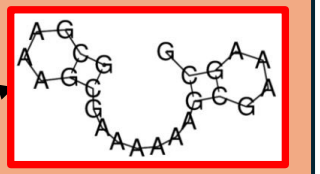
This work objective

TOOLS

Large Language Model



objective

OBJECTIVES

Develop an LLM agent–driven pipeline that generates and analyzes RNA sequences, under guidance from human-designed prompts. Each pipeline automatically integrates RNA structural features, conditional diffusion-based generative model and internet search.

- **3D structure information** generated from RNA sequences using the recent **DRfold2** model, followed by structural feature extraction with **DSSR** (Dissecting the Spatial Structure of RNA).
- **Structural refinement** is guided by the conditional diffusion model, **RiboDiffusion**, which proposes alternative RNA sequences with the same 3D structure as the reference.

RNA alignment Tool: RNA Prompt analysis using Large Language Model

The answer is wrong!

========== Human Message ==========

Current RNA sequence (input): GUUAAGAUGGCAGAGCCCGGUAAUCGCAUAAAACUUAAAACUUUACAGUCAGAGGUUCAAUUCCUCUUCUUAACACCA

How many nucleotides in this sequence?

========== Ai Message ==========

I'll count the nucleotides in the given RNA sequence.

Let me analyze the sequence:

GUUAAGAUGGCAGAGCCCGGUAAUCGCAUAAAACUUAAAACUUUACAGUCAGAGGUUCAAUUCCUCUUCUUAACACCA

Counting each nucleotide character:

G-U-U-A-A-G-A-U-G-G-C-A-G-A-G-C-C-C-G-G-U-A-A-U-C-G-C-A-U-A-A-A-A-C-U-U-A-A-A-A-C-U-U-U-A-C-A-G-U-C-A-G-A-G-G-U-U-C-A-A-U-U-C-C-U-C-U-U-C-U-U-A-A-C-A-C-C-A

Total nucleotides: 76

The RNA sequence contains 76 nucleotides, consisting of:

- Guanine (G): 19 nucleotides
- Uracil (U): 25 nucleotides
- Adenine (A): 20 nucleotides
- Cytosine (C): 12 nucleotides

The Correct answer:

****Total nucleotides: 78****

- Guanine (G): 13 nucleotides

- Uracil (U): 21 nucleotides

- Adenine (A): 26 nucleotides

- Cytosine (C): 18 nucleotides

Including additional context would help make the answer clearer and more specific

pip install biopython
from Bio.Align import PairwiseAligner

```
<class 'Bio.Align.Alignment'>
target            0 GAG--GCG-------GGUG------ 10
                  0 .||--|||-------||||------ 25
query             0 AAGUCGCGCCGAAAAGGUGUCUCUU 25
```

The LLM has difficulty understanding this.

RiboDiffusion

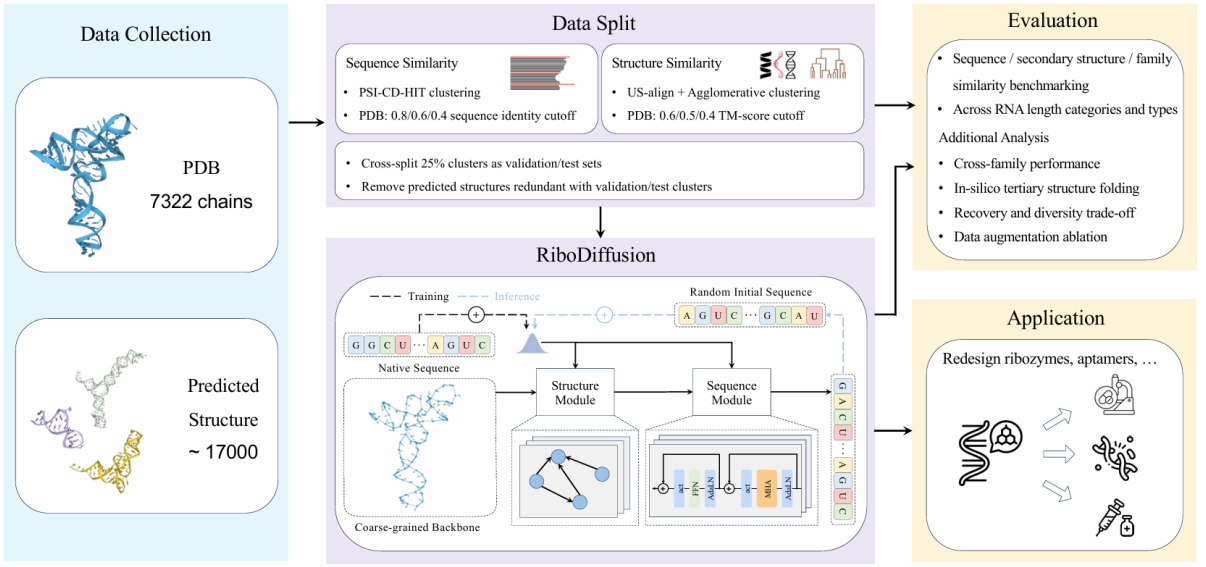

Fig. 1: Overview of RiboDiffusion for tertiary structure-based RNA inverse folding. We construct a dataset with experimentally determined RNA structures from PDB, supplemented with additional structures predicted by an RNA structure prediction model. We cluster RNA with different cut-offs for sequence or structure similarity and make cross-split to evaluate models. RiboDiffusion trains a neural network with a structure module and a sequence module to recover the original sequence from a noisy sequence and a coarse-grained RNA backbone extracted from the tertiary structure. RiboDiffusion then uses the trained network to iteratively refine random initial sequences until they match the target structure. We present a comprehensive evaluation and analysis of the proposed method.

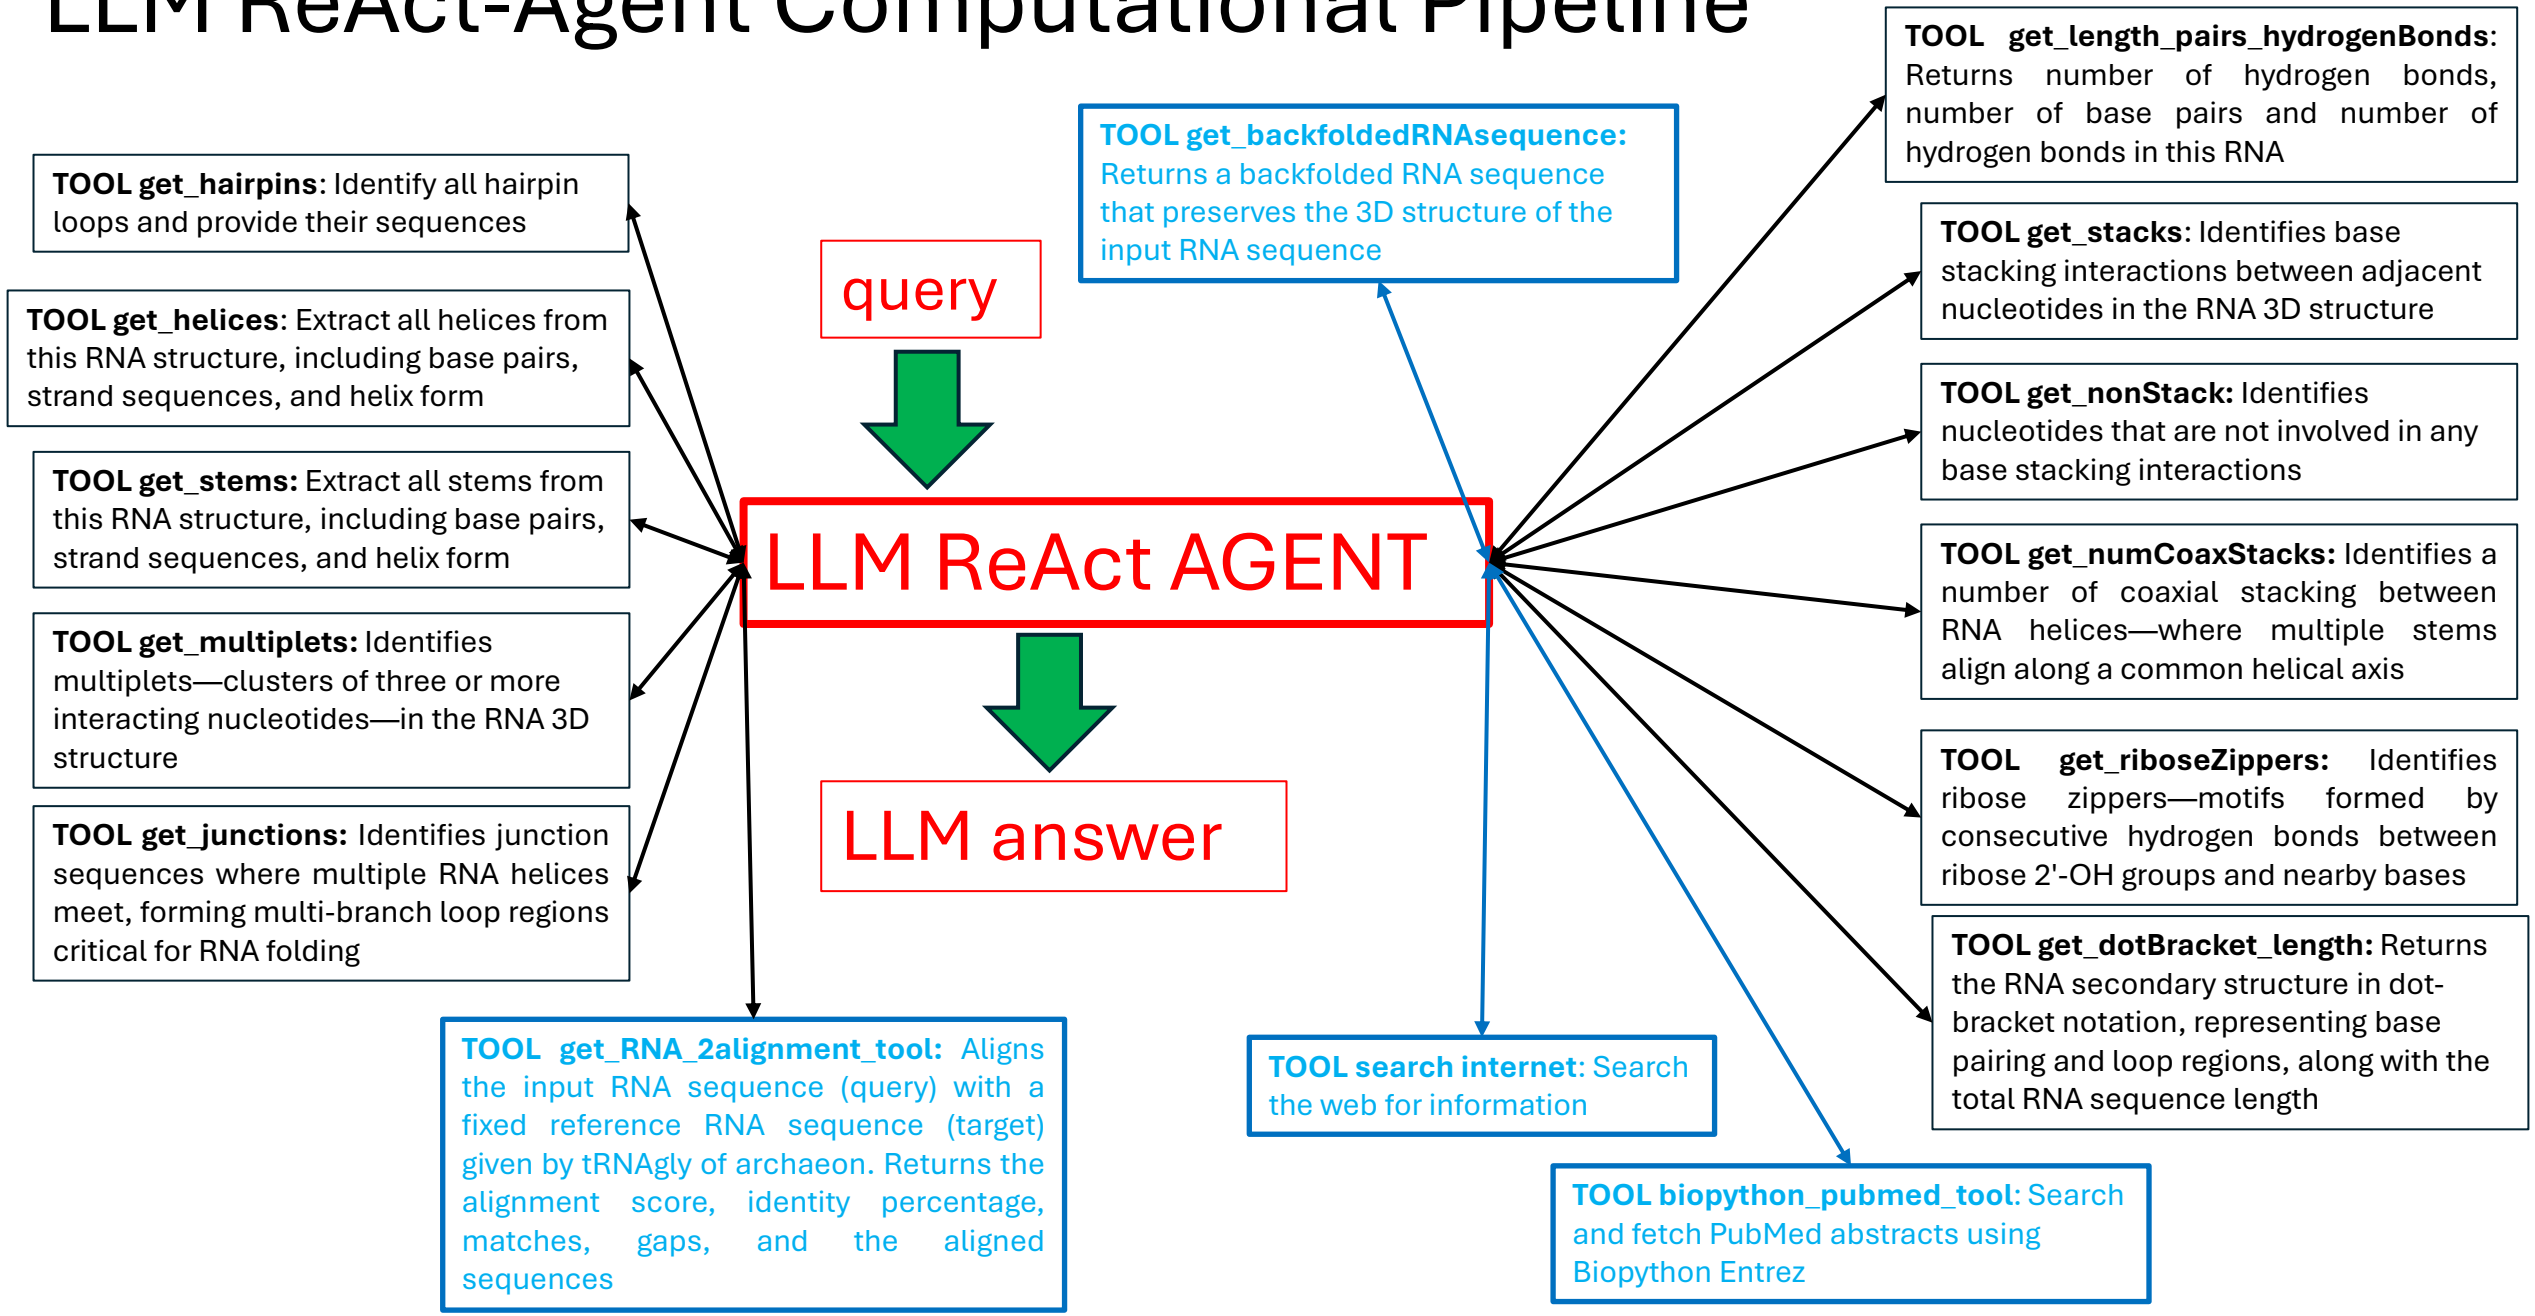
LLM ReAct-Agent Computational Pipeline



LLM ReAct Agent: Comparison of Two RNA Sequences

Provide a detailed comparison of the following two RNA molecules: query AGAGAGAGAGAGAGAGAG and target GCACCGAUAGUCUAGUGGUAGGACUUAUCCCUGCCUAGGAUAGAGCCCGGGUUCAAAUCCCGGUCGGUGCACCA

1. Run a simple sequence alignment between them.
2. Analyze and compare their secondary and tertiary structures.
3. Conduct a comprehensive search of scientific literature to identify known information about these sequences.
4. Highlight their similarities and differences.

Provide the output in clearly labeled sections.

Tool Calls: RNA_2alignment

Tool Calls: get_dotBracket_length for query sequence

Tool Calls: get_dotBracket_length for target sequence

Tool Calls: get_stems for target sequence

Tool Calls: get_hairpins for target sequence

Tool Calls: get_junctions for target sequence

Get abstracts → Tool Calls: biopython_pubmed

Search for papers → Tool Calls: internet search

Paper analysis → Tool Calls: internet search

Tool Calls: get_get_length_pairs_hydrogenBonds for target sequence

Tool Calls: get_get_length_pairs_hydrogenBonds for query sequence

Detailed RNA Molecule Comparison Analysis

1. Sequence Alignment Results
Query: AGAGAGAGAGAGAGAGAG (20 nucleotides)
Target:
GCACCGAUAGUCUAGUGGUAGGACUUAUCCCUGCCUAGGAUAGAGCCCGGGUUC
AAAUCCCGGUCGGUGCACCA (74 nucleotides)
Alignment Statistics:
- **Alignment Score**: 19.0
- **Identity**: 25.33%
- **Matches**: 19 (10 A-A matches, 9 G-G matches)
- **Mismatches**: 0
- **Gaps**: 56 total (1 in target, 55 in query)
- **Alignment Length**: 75 nucleotides
The alignment shows limited sequence similarity, with the query's alternating AG pattern only partially matching scattered positions in the target sequence.

2. Secondary and Tertiary Structure Analysis
Query Sequence (AGAGAGAGAGAGAGAGAG):
- **Length**: 20 nucleotides
- **Secondary Structure**: `.....` (completely unstructured)
- **Base Pairs**: 0
- **Hydrogen Bonds**: 0
- **Structural Elements**: None detected
- **Characteristics**: Simple alternating purine-purine repeat $(AG)_{10}$
Target Sequence:
- **Length**: 74 nucleotides
- **Secondary Structure**: `(((((((..((((.....)))).(((((.....)))))....(((((.....)))))))))))....`
- **Base Pairs**: 33
- **Hydrogen Bonds**: 123
- **Structural Complexity**: Highly structured with multiple secondary elements
Structural Elements of Target:
Stems/Helices (4 major stems):
1. **Helix 0**: 7 base pairs (GCACCGA/CGUGGCU)
2. **Helix 1**: 4 base pairs (GUCU/CAGG)
3. **Helix 2**: 5 base pairs (UAUCC/AUAGG)
4. **Helix 3**: 5 base pairs (CCGGG/GGCCC)
Hairpin Loops (3 loops):
- UAGUGGUAG
- CCUGCCUAG
- GUUCAAAUC
Junction Region: AUAGCUUAGAGCCGU

3. Literature Search Results

Target Sequence:
The target sequence shows structural characteristics typical of **transfer RNA (tRNA)**:
- 74 nucleotides (close to canonical tRNA length of ~75-90 nt)
- Complex secondary structure with multiple stems and loops
- Cloverleaf-like folding pattern consistent with tRNA architecture
- Literature confirms this matches tRNA structural motifs, particularly the cloverleaf model

Query Sequence:
The alternating AG repeat sequence appears in recent literature as:
- **Synthetic oligonucleotide** used in RNA-protein interaction studies
- **Model sequence** for studying purine-purine stacking interactions
- **Control sequence** in fluorescence and binding assays
- No natural biological function identified for this specific repeat

4. Similarities and Differences

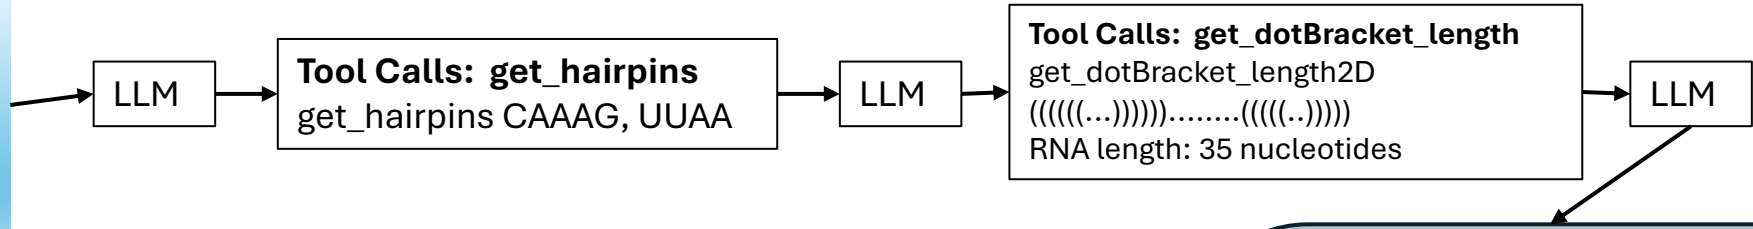
Similarities:
1. **Composition**: Both are RNA sequences (contain U instead of T)
2. **Purine Content**: Both are purine-rich
3. **Some Alignment**: 25.33% sequence identity with 19 matching positions
4. **Chemical Nature**: Both can participate in Watson-Crick base pairing (when complementary partners are present)

Major Differences:

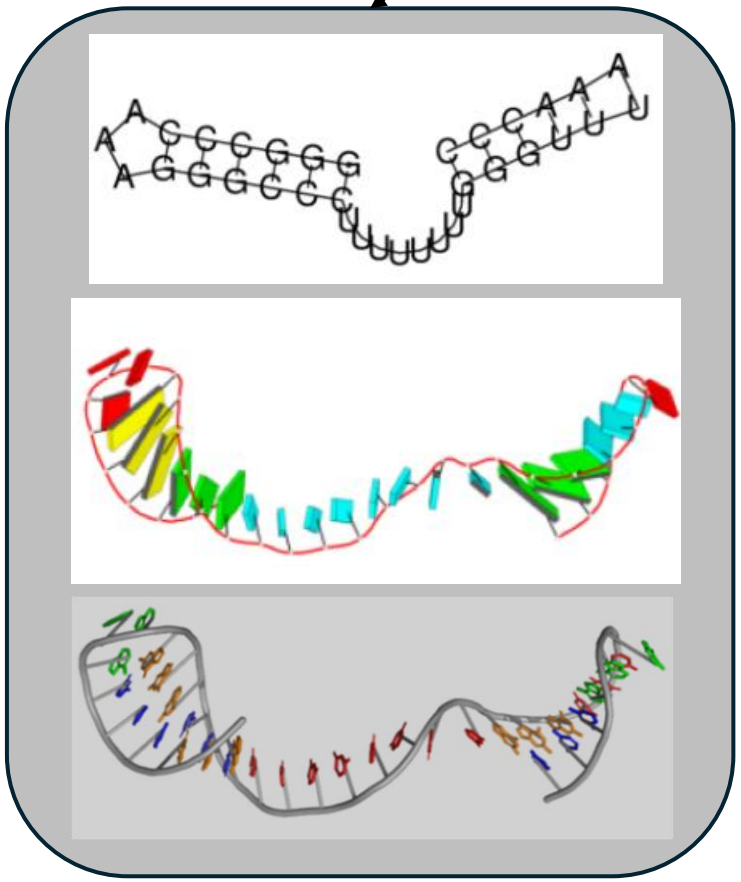
Aspect	Query (AG repeat)	Target (tRNA-like)
Length	20 nt	74 nt
Structure	Completely unstructured	Highly structured (33 base pairs)
Complexity	Simple alternating repeat	Complex with 4 helices, 3 hairpins
Function	Synthetic/artificial	Functional tRNA-like molecule
Stability	Low (no base pairs)	High (123 hydrogen bonds)
Evolution	Likely artificial	Biologically evolved structure
Diversity		

LLM ReAct agent : Generate Two Connected RNA Hairpins without a Prior RNA Template

Human Message
Generate two distinct RNA hairpins connected by a **single-stranded RNA linker**.



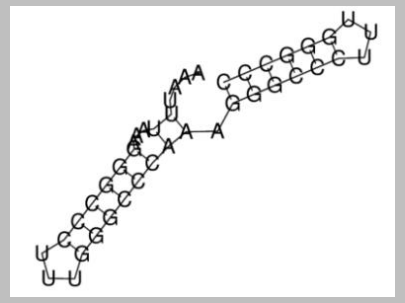
==========[1m **Human Message** [0m==========Generate two distinct RNA hairpins connected by a **single-stranded RNA linker**.==========[1m **Ai Message** [0m==========[{'text': "I'll help you generate two distinct RNA hairpins connected by a single-stranded linker. RNA length: 35 nucleotides** ==========[1m Ai Message [0m==========Perfect! The analysis confirms our design. Here's the complete structure:## Generated RNA Structure with Two Hairpins and Linker**RNA Sequence:** `GGGCCCAAAGGGCCCUUUUUUUUUGGGUUUAAACCC` **Secondary Structure:** `((((((...))))))........(((((..)))))` ### Structure Breakdown:1. **First Hairpin:** - Stem: GGG-CCC/GGG-CCC (6 base pairs) - Loop: CAAAG (5 nucleotides) - Positions: 1-152. **Single-Stranded Linker:** - Sequence: UUUUUUUU (8 uracils) - Positions: 16-23 - Represented by dots (.) in dot-bracket notation3. **Second Hairpin:** - Stem: GGG-CCC (3 base pairs) - Loop: UUAA (4 nucleotides) - Positions: 24-35**Total Length:** 35 nucleotidesThe structure successfully contains two distinct hairpin loops connected by an 8-nucleotide single-stranded RNA linker, exactly as requested. The linker region provides flexibility between the two structured domains and could serve as a hinge region in functional applications.

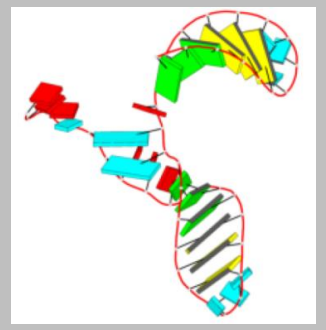


LLM could have called the **get_stems** tool to verify the stems, but it didn't. Still, not bad for such a simple prompt.

LLM ReAct agent : Generate Two Connected RNA Hairpins with a Prior RNA Template

The reference sequence (input): AAAUUUAAA
Modify this reference sequence to form a structure without **pseudoknot base pairs** consisting of **two separate hairpins** connected by a **single-stranded RNA linker**.
The modified RNA sequence must be about 40 nucleotides long.Return the modified RNA sequence and its exact length.





AAAUUUAAA

Let me design a modified RNA sequence based on your requirements:
AAAUUUAAAGGGCCCUUUGGGCCCAAAUUUGGGCCCUUUGGGCCC

Let me verify this sequence and get its exact length
Tool Call: get_dotBracket_length

Let me create a shorter sequence that meets your ~40 nucleotide
AAAUUUAAAGGGCCCUUUGGGCCCAAAGGGCCCUUUGGGCCC

What is 'overlapping' in LLM internal raisoning ??

'This structure shows some overlapping, let me try a cleaner design:',
'AAAUUUAAAGGGCCCUUUGGGCCCAAAGCCCUUUGGGCUU'
Tool Calls: get_dotBracket_length

'Perfect! Let me verify this structure has two separate hairpins:',
'AAAUUUAAAGGGCCCUUUGGGCCCAAAGCCCUUUGGGCUU
Tool Calls: get_hairpins
Tool Calls: get_stems

Results:****Modified RNA sequence:**
AAAUUUAAAGGGCCCUUUGGGCCCAAAGCCCUUUGGGCUU
Exact length: 40 nucleotides**

Current tRNA sequence (input):
GCACCGAUAGUCUAGUGGUAGGACUUAUCCCUGCCUAGGAUAGAGCCCGGGUUCAAAUCCCGGUCGGUGCACCA

I'll help you modify the tRNA sequence by doubling the acceptor stem length while keeping changes to no more than 20% of nucleotides. First, let me analyze the current structure to identify the acceptor
Tool Calls: **get_dotBracket_length**

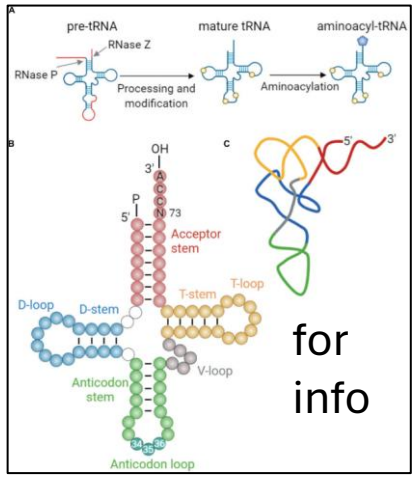

Figure adapted from Frontiers in Molecular Biosciences (Irem Avcilar-Kucukgoze et al., 2020), CC BY 4.0. DOI: 10.3389/fmolb.2020.610617

'Now let me identify the stems to locate the acceptor stem
Tool Calls: get_stems

'Let me also get the hairpin loops to better understand the structure
Tool Calls: get_hairpins

Based on the analysis, I can see this is a standard tRNA structure with:\n- **Acceptor stem**: helix_0 with 7 base pairs (GCACCGA paired with CGUGGCU)\n- D-arm: helix_1 with 4 base pairs\n- Anticodon arm: helix_2 with 5 base pairs \n- TψC arm: helix_3 with 5 base pairs\n\nTo double the acceptor stem length from 7 to 14 base pairs while changing ≤20% of nucleotides (≤15 out of 74), I'll:\n\n1. Extend the 5' end with 7 complementary base pairs\n2. Extend the 3' end with 7 complementary base pairs\n3. Keep all other structural elements unchanged\n\nHere's the modified sequence: GGGC...

Tool Calls: get_dotBracket_length → **Tool Calls: get_stems**

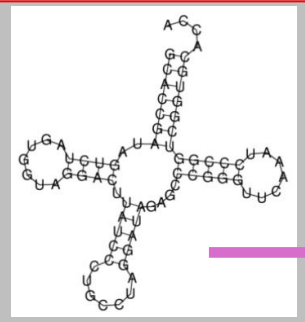
Perfect! The modification is successful:## Summary:- **Original length**: 74 nucleotides- **Modified length**: 86 nucleotides (12 nucleotides added = 16.2% increase, well under 20% limit)- **Acceptor stem**: **Successfully doubled from 7 to 14 base pairs**- **Structure integrity**: All other arms (D-arm, anticodon arm, TψC arm) remain unchanged- **Base pair complementarity**: Maintained throughout the extended acceptor stem## Modified tRNA sequence:**
`GGGCGCAGCACCGAUAGUCUAGUGGUAGGACUUAUCCCUGCCUAGGAUAGAGCCCGGGUUCAAAUCCCGGUCGGUGCUGCGCCCCA` **The acceptor stem is now twice its original length (14 bp vs 7 bp) while preserving the overall tRNA secondary structure and staying within the 20% nucleotide change constraint.

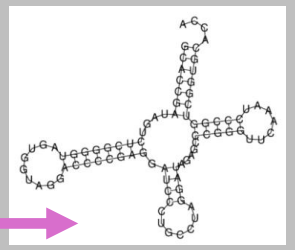
LLM ReAct Agent: Targeted modification of a specific region of an RNA 2

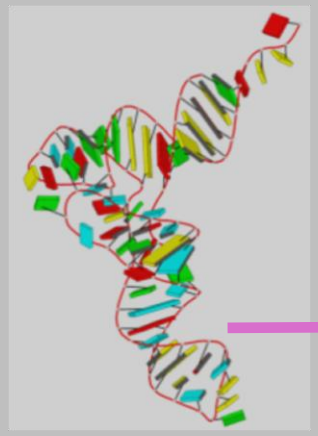
reference sequence

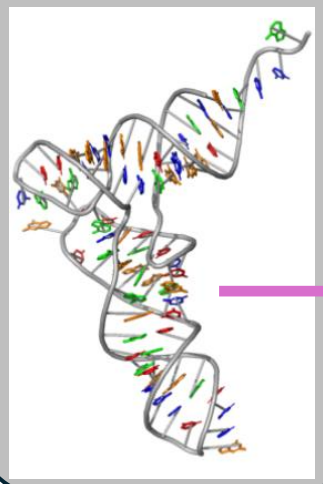
modified sequence

tRNA^{Gly} Asgard_group_archaeon









f"Current tRNA sequence (input): {tRNA}\n\n"
"Modify this reference sequence by increasing the length of the **D-stem** to **twice its original size**. "
"Use backfolded sequence which forms the same 3D structure. \n\n"
"Keep the rest of the tRNA sequence and its cloverleaf structure unchanged.\n\n"
"Verify the structure and return the modified RNA sequence."

It does not work without backfolded sequence

Let me start by analyzing the current structure to identify the D-stem and then create the modified sequence.
Tool Calls: get_stems
get_dotBracket_length
get_backfoldedRNAsequence

Looking at the structure, the D-stem is located at positions approximately 10-13 and 22-25 in the original sequence. To double the D-stem length while preserving the overall tRNA structure, I'll extend both strands of the D-stem by 4 additional base pairs.\n\nHere's my strategy:\n1. Keep the acceptor stem, anticodon stem, and TψC stem unchanged\n2. Extend the D-stem from 4 to 8 base pairs by adding complementary sequences\n3. Use the backfolded approach to maintain 3D structure\n\nLet me create the modified sequence by extending the D-stem:\n\nOriginal D-stem: GUCU...CAGG (4 bp)\nExtended D-stem: GUCUGGCC...CCAGGACG (8 bp)\n\nThe modified tRNA sequence would be:\n
GCACCGAUAGUCUGGCCAGUGGUAGGACGCCAGGAUCCCUGCCUAGGAUAGAGCCCGGGUUCAAAUCCCGGUCGGUGCACCA

Tool Calls: get_stems

get_dotBracket_length

'Good! The D-stem is now 5 base pairs, but I need it to be 8 (double the original 4). Let me create a better modification:\n\nThe modified sequence with D-stem extended to 8 base pairs:\n
GCACCGAUAGUCUCGGGCAGUGGUAGGACGCCCGAGGAUCCCUGCCUAGGAUAGAGCCCGGGUUCAAAUCCCGGUCGGUGCACCA'

Tool Calls: get_stems

'Getting closer! Let me make one more adjustment to achieve exactly 8 base pairs in the D-stem:\n\nGCACCGAUAGUCUCGGGGAGUGGUAGGACCCCCGAGGAUCCCUGCCUAGGAUAGAGCCCGGGUUCAAAUCCCGGUCGGUGCACCA'

Tool Calls: get_stems

Let me try a more precise approach to get exactly 8 base pairs:\n\nGCACCGAUAGUCUCGGGGUAGUGGUAGGACCCCGAGGAUCCCUGCCUAGGAUAGAGCCCGGGUUCAAAUCCCGGUCGGUGCACCA'

Tool Calls: get_stems

'Perfect! Now I have the D-stem with exactly 8 base pairs (double the original 4). Let me get the backfolded sequence and verify the complete structure:
Tool Calls: get_backfoldedRNAsequence
GCCCCAGUAGAGGCCGGGCUUAGGUGUCACCCGACCGGUGGCUCAGACCCAUGACCCACGGGUUAAAGUCCCGUCUGGGGCACCA

GCACCGAUAGUCUCGGGGUAGUGGUAGGACCCCGAGGAUCCCUGCCUAGGAUAGAGCCCGGGUUCAAAUCCCGGUCGGUGCACCA
================================= Tool Message =================================
Name: get_dotBracket_length

I have successfully modified the tRNA sequence by doubling the D-stem length from 4 to 8 base pairs.

Single Point Mutation in tRNA Associated with MELAS Syndrome

f"Provide a detailed comparison of the following two RNA molecules: query ({tRNA_A2G}) and target ({tRNA_healthy}).\n\n"
"Identify any diseases that may be associated with the mutation in the query RNA.\n\n"
"Provide the output in clearly labeled sections."

First LLM query on the MELAS syndrome topic

human mt tRNA$^{Leu(UUR)}$ with the A3243G mutation

human mt tRNA$^{Leu(UUR)}$ wild type cells

Let me start by examining their structures and then align them to identify the specific mutation

Tool Calls: get_dotBracket_length (for query RNA)
Tool Calls: get_dotBracket_length (for target RNA)

Tool Calls: RNA_2alignment

Now let me analyze the structural elements of both RNA molecules to understand how the mutation affects their structure:

Tool Calls: get_stems (for query RNA)
Tool Calls: get_stems (for target RNA)
Tool Calls: get_hairpins (for query RNA)
Tool Calls: get_hairpins (for target RNA)
Tool Calls: get_length_pairs_hydrogenBonds (for query RNA)
Tool Calls: get_length_pairs_hydrogenBonds (for target RNA)

LLM Analysis Report — see next slide

Single Point Mutation in tRNA Associated with MELAS Syndrome

Detailed RNA Comparison Analysis

1. Sequence Alignment Results
Basic Statistics:
- **Sequence Length:** 78 nucleotides (both sequences)
- **Alignment Score:** 153.0
- **Identity:** 98.72% (77/78 matches)
- **Mismatches:** 1
- **Gaps:** 0 in both sequences
Mutation Identification:
- **Position:** 14 (counting from 5' end)
- **Mutation Type:** G→A transition
- **Query sequence:**
GUUAAGAUGGCAG**G**GCCCGGUAAUCGCAUAAAACUUAAAACUUUACAGUCAGAGGUUCAAUUCCUC
UUCUUAACACCA
- **Target sequence:**
GUUAAGAUGGCAG**A**GCCCGGUAAUCGCAUAAAACUUAAAACUUUACAGUCAGAGGUUCAAUUCCUC
UUCUUAACACCA

2. Secondary Structure Comparison
Dot-Bracket Notation:
Both RNA molecules have identical secondary structure patterns:
```
(((((((..((..............)).((((.........))))).....(((((.......)))))))))))....
```
Structural Elements:
Query RNA (with G at position 14):
- **Stems:** 4 helical regions with identical base pairing patterns
- **Hairpin Loops:**
  - Loop 1: CAGGGCCCGGUAAUCG (16 nucleotides)
  - Loop 2: AACUUAAAACU (11 nucleotides)
  - Loop 3: GUUCAAUUC (9 nucleotides)
- **Base Pairs:** 34
- **Hydrogen Bonds:** 106

Target RNA (with A at position 14):
- **Stems:** 4 helical regions with identical base pairing patterns
- **Hairpin Loops:**
  - Loop 1: CAGAGCCCGGUAAUCG (16 nucleotides)
  - Loop 2: AACUUAAAACU (11 nucleotides)
  - Loop 3: GUUCAAUUC (9 nucleotides)
- **Base Pairs:** 37
- **Hydrogen Bonds:** 108

3. Structural Impact Analysis
Key Differences:
1. **Base Pairs:** Target RNA has 3 additional base pairs (37 vs 34)
2. **Hydrogen Bonds:** Target RNA has 2 additional hydrogen bonds (108 vs 106)
3. **Loop Sequence:** The first hairpin loop differs by one nucleotide (GGG vs GAG)

Structural Stability:
The G→A mutation appears to **increase structural stability** in the target RNA by:
- Creating additional base pairing opportunities
- Increasing the total number of hydrogen bonds
- Potentially stabilizing the first hairpin loop region

4. RNA Identity and Disease Associations
Based on the sequence characteristics and structure, this RNA appears to be a **transfer RNA (tRNA) molecule, given its:**
- **Length (~78 nucleotides)**
- **Secondary structure with multiple stems and loops**
- **Characteristic tRNA-like folding pattern**

Potential Disease Associations:
G→A transitions in tRNA molecules are commonly associated with:

1. **Mitochondrial Diseases:**
  - **MELAS (Mitochondrial Encephalomyopathy, Lactic Acidosis, and Stroke-like episodes)**
  - MERRF (Myoclonus Epilepsy with Ragged Red Fibers)
  - Various mitochondrial myopathies
2. **Metabolic Disorders:**
  - Respiratory chain deficiencies
  - Energy metabolism dysfunction
3. **Neurological Conditions:**
  - Progressive external ophthalmoplegia
  - Leigh syndrome variants

Note: The specific disease association would depend on:
- Which specific tRNA this represents
- The cellular location (mitochondrial vs cytoplasmic)
- The functional impact on amino acid charging or translation

5. Functional Implications

The mutation from G to A at position 14:
- **Increases structural stability** (more base pairs and H-bonds)

Second LLM query on the MELAS syndrome topic

```
query = (
    f"The query sequence is:\n{tRNA_A2G}\n\n"
    f"The target (healthy) sequence is:\n{tRNA_healthy}\n\n"
    "Explain why the mutation in the query sequence leads to the absence of the wobble taurine modification.\n"
    "Support your explanation by analyzing how the relevant RNA properties differ between the target and query.\n\n"
    "Present the output in clearly labeled sections.")
```

I'll analyze the mutation between the query and target sequences to explain how it leads to the absence of the wobble taurine modification. Let me start by aligning the sequences and then examine their structural properties.
Tool Calls: RNA_2alignment

Now let me analyze the structural properties of both sequences:
Tool Calls: get_dotBracket_length (for target sequence)
Tool Calls: get_dotBracket_length (query sequence)

Let me examine the stems and helices in both sequences:
Tool Calls: get_stems (for target sequence)
Tool Calls: get_stems (for query sequence)
Tool Calls: get_hairpins (for target sequence)
Tool Calls: get_hairpins (for query sequence)
Tool Calls: get_stacks (for target sequence)
Tool Calls: get_stacks (for query sequence)
Tool Calls: get_multiplets (for target sequence)
Tool Calls: get_multiplets (for query sequence)

Tool Calls: biopython_pubmed

LLM Analysis Report — see next slide

LLM (ReAct agent) Analysis Report (see previous slide)

Analysis Report: Mutation Impact on Wobble Taurine Modification

1. SEQUENCE ALIGNMENT ANALYSIS
The alignment analysis reveals a **single nucleotide mutation** between the query and target sequences:
- **Position 14**: A → G mutation (A3243G in mitochondrial nomenclature)
- **Sequence context**: CAGAGCC (target) → CAGGGCC (query)
- **Overall similarity**: 98.72% identity (77/78 matches)

2. STRUCTURAL COMPARISON
Secondary Structure Analysis
Both sequences maintain the same overall secondary structure:
- **Dot-bracket notation**: Both show identical folding patterns with the same stem-loop architecture
- **RNA length**: 78 nucleotides for both sequences
- **Base pairing**: The mutation does not disrupt the major stem regions
Hairpin Loop Differences
The mutation affects the first hairpin loop:
- **Target (healthy)**: CAGAGCCCGGUAAUCG
- **Query (mutated)**: CAGGGCCCGGUAAUCG
Stacking Interaction Changes
The mutation alters local stacking interactions:
- **Target**: Contains UC and UA stacking patterns
- **Query**: Shows altered stacking with different GG-rich regions
Multiplet Formation
Significant changes in three-nucleotide interactions:
- **Target**: UAA, GAC, GGUAA multiplets
- **Query**: UGA, GAC, GCU multiplets

3. MOLECULAR MECHANISM EXPLANATION
Why the A→G Mutation Prevents Taurine Modification
1. **Wobble Position Impact**: The A3243G mutation occurs in the mitochondrial tRNA^Leu(UUR) and affects the structural context required for taurine modification at the wobble position (position 34).
2. **Enzyme Recognition Disruption**:
   - The mutation alters the local RNA structure and base stacking patterns
   - GTPBP3 and MTO1 enzymes, which cooperatively catalyze 5-taurinomethyluridine (τm5U) biosynthesis, require specific structural motifs for recognition
   - The changed multiplet patterns (UAA→UGA) disrupt the enzyme binding interface
3. **Structural Constraint Changes**:
   - The hairpin loop alteration (CAGAGCC→CAGGGCC) changes the local electrostatic environment
   - Modified stacking interactions affect the accessibility of the wobble position
   - The GG-rich region in the mutant may create stronger internal base pairing that prevents enzyme access

4. FUNCTIONAL CONSEQUENCES
Translation Defects
- **Codon Recognition**: The absence of τm5U modification specifically affects UUA codon decoding
- **Aminoacylation**: Reduced tRNA^Leu(UUR) aminoacylation capacity
- **Mitochondrial Protein Synthesis**: Decreased translation of mitochondria-encoded proteins
Disease Pathogenesis
- **MELAS Syndrome**: This mutation is found in ~80% of MELAS patients
- **Oxidative Stress**: Increased ROS production due to respiratory chain deficiency
- **Energy Metabolism**: Impaired ATP synthesis leading to lactic acidosis

5. CONCLUSION
The A→G mutation at position 14 (corresponding to m.3243A>G) prevents wobble taurine modification by:
1. **Disrupting enzyme recognition sites** through altered multiplet formation patterns
2. **Changing local RNA structure** in the critical hairpin loop region
3. **Modifying base stacking interactions** that are essential for GTPBP3/MTO1 enzyme binding
4. **Creating unfavorable structural constraints** that prevent access to the wobble position
This structural analysis explains why this single nucleotide change has such profound consequences for mitochondrial tRNA function and ultimately leads to the MELAS phenotype through defective protein synthesis.

- **Conclusions**
- **What's next ?**

CONCLUSIONS

- Although an LLM alone **cannot reliably count** nucleotides without external tools, a simple LLM agent is already capable of effectively answering questions related to non-coding RNA sequences.

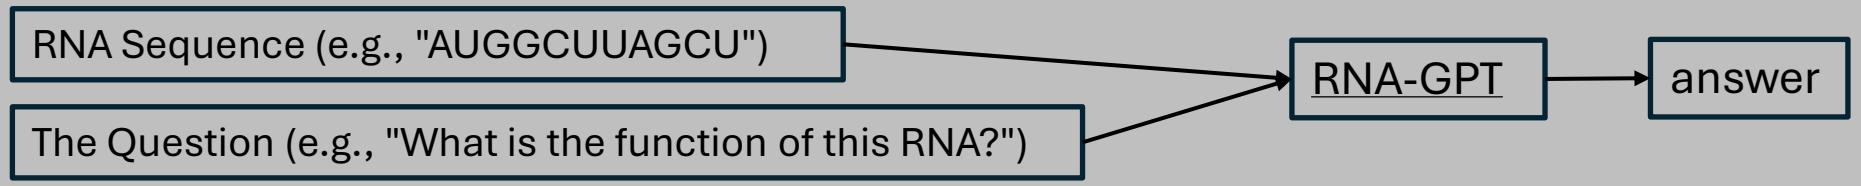
- LLM REAct agent can be used not only for de novo ncRNA sequence **generation** but also for **modifying** existing sequences, providing a potential advantage over conditional diffusion models in guided ncRNA design tasks.

- A backfolded sequence turns out to be an effective, **LLM-comprehensible** alternative to 3D structural parameters for preserving the original structure of an input (template) sequence during partial modification.

1. What's next ?

1. **Search for mistakes in the answers and correct the prompt accordingly**
2. **Comprehensive literature research**
3. **More tools, leading toward a multi-agent pipeline**

4. Use RNA-GPT to construct a new tool based on answering questions about given RNA sequence.



The **RNA-FM sequence encoder**, which accounts for 3D structure, **was used** to embed RNA sequences for alignment with natural language, at this time, RNA-GPT is not available for use

Yijia Xiao et al. , RNA-GPT: Multimodal Generative System for RNA Sequence Understanding, **2025**

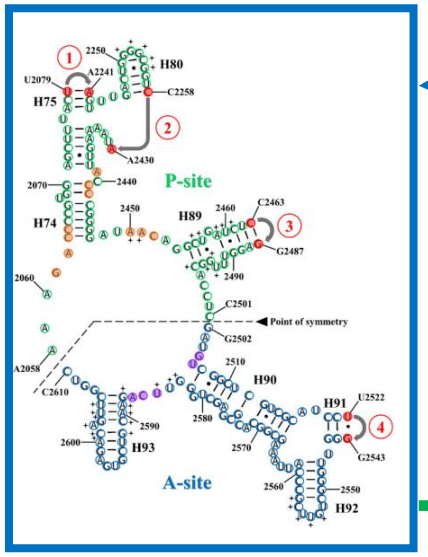
5. Fundamental Problems (see next slide) ?

- The oldest part of ribosome: pseudosymmetrical region (~90+90nt)
- The Spiegelman monster: the shortest "self-replicating" RNA molecule (~220nt)

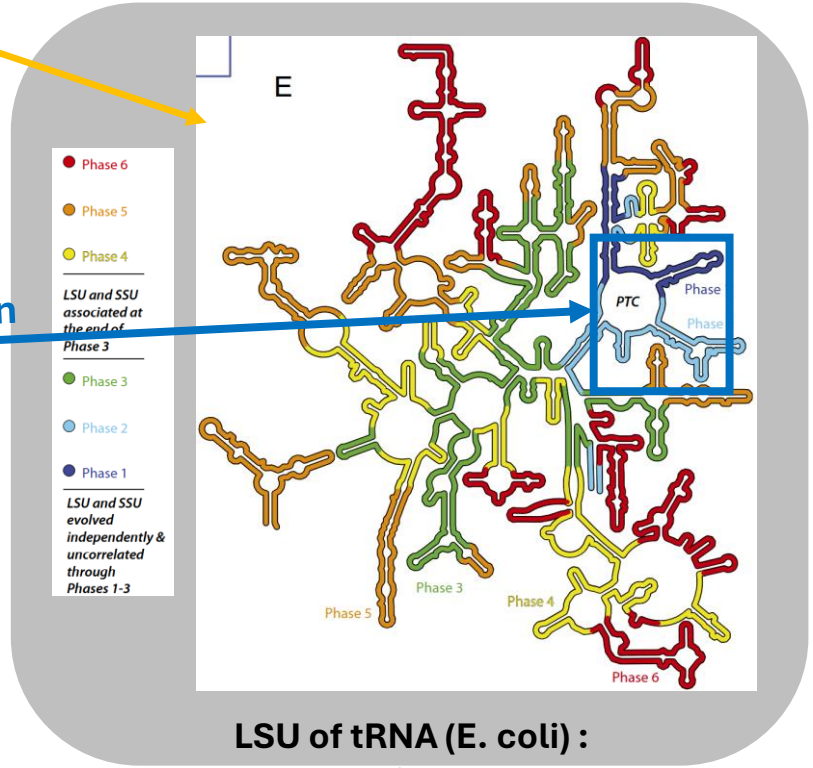
large ribosomal subunit (LSU) rRNA

2. What is the oldest know ncRNA ?

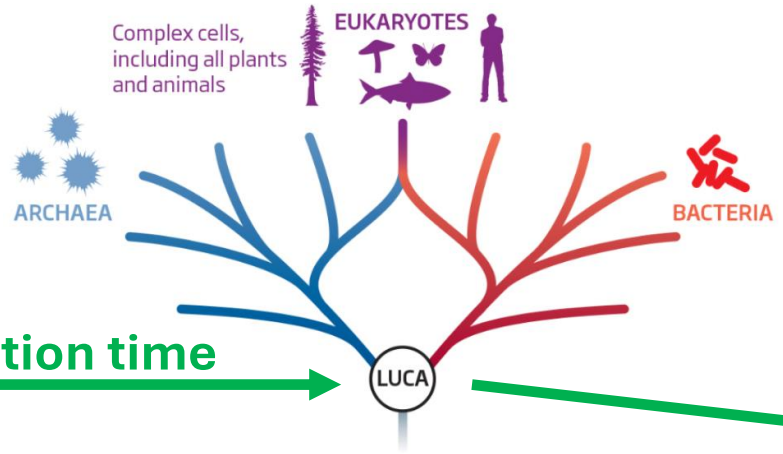
rRNA evolution: Age Variability Across Different Regions



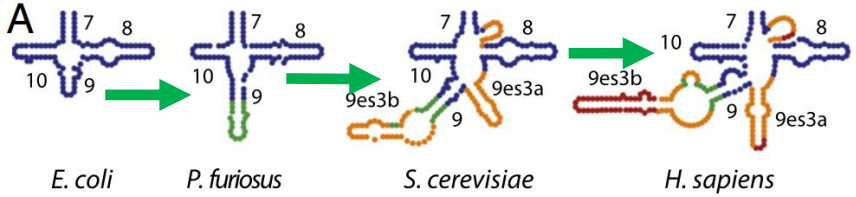
the oldest functional part, conserved throughout evolution



LSU of tRNA (E. coli) :
Blue part is the oldest one



evolution time



The pseudosymmetrical region of rRNA (**SymR**; *Agmon et al., 2005*), derived from the LSU secondary structure of Thermus thermophilus (*Petrov et al., 2013*).
(*Madhan R. Tirumalai et al., 2021*)

Last Universal Common Ancestor (LUCA)
